**Free Memory Screenings** at the Greendale Health Department on Tuesday October 8th: Are you concerned about your memory? It is important, as we get older, to recognize the changes we may experience, especially in relation to our memory. A cognitive screen/memory screen is defined as a wellness tool that helps identify possible changes in memory and cognition. It creates a baseline of where a person is at so that future changes can be monitored. This is not a diagnostic tool, but a screen that can provide early detection for dementia. The memory screen process is very simple in which you will be asked to answer some questions and complete a task. The screen takes about 15-30 minutes. Early detection is important because: It allows persons with dementia to prioritize and to be proactive in planning for their futures; Current treatments are more effective in earlier stages of Alzheimer’s Disease; There is greater opportunity to educate caregivers; It may improve quality of life for persons with dementia and their families and may help to control long term care costs. Please call 414-423-2110 to schedule your free memory screen.
